

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. - 16. (canceled).

17. (currently amended): A wristband with a clasp including electrical connection means for electrical connection to at least one electric or electronic component, the electrical connection means including an electric connector arranged in one part of the clasp, said connector being configured so as to be able to be connected, when the clasp is in the open position, to a connector of complementary shape of an electric apparatus to carry out data and/or electric energy transmission with at least one electric or electronic component,

wherein the electric connector fixed to one end of a strand of the wristband forms a male part of the clasp, which is covered when the clasp is in the closed position by a fastening piece of another end of the same strand or an end of ~~the other~~ another wristband strand, and

wherein bellows of the clasp are fixed to the other end of the wristband strand or the end of the other wristband strand underneath the fastening piece to enclose and protect the electric connector when the clasp is in the closed position with the bellows slightly compressed against a sleeve fixed to the end of the wristband strand with the electric connector.

18. (previously presented): The wristband according to claim 17, wherein the electric connector defines an electric connector of the universal serial bus type so as to be able to be connected to a connector of complementary shape of a computer station for data transfer.

19. (previously presented): The wristband according to claim 17, wherein it includes the electric or electronic component electrically connected to the electric connector.

20. (previously presented): The wristband according to claim 17, wherein the clasp includes a male part formed by the connector, which can be inserted into a female part when the clasp is in the closed position.

21. (withdrawn): The wristband according to claim 20, wherein the female part of another end of the same wristband strand or one end of another strand of the wristband includes a cavity of complementary shape to the electric connector.

22. (previously presented): The wristband according to claim 17, wherein the clasp of the unfolding buckle type includes a base, and two strips or two limbs each hinged to an opposite end of the base, the first strip or the first limb being connected to the end of a first wristband strand, whereas the second strip or the second limb is connected to the end of a second wristband strand, and wherein the electric connector is fixed to the end of the first wristband strand.

23. (withdrawn): The wristband according to claim 22, wherein the extending type base includes a receptacle and an element able to slide in part into the receptacle, the element being held in part inside the receptacle by a return spring in the direction of a closed position of the clasp, wherein the connector is fixed to one end of the first strand with one part of the first limb, and wherein the second limb is fixed to one end of the second strand, which includes the cavity of complementary shape to the connector to receive the latter in the closed position.

24. (previously presented): The wristband according to claim 22, wherein the base includes two parallel arms separated by a central bar, one end of the first strip being hinged

between the arms at one end of the arms, whereas one end of the second strip is hinged between the arms to a second opposite end of the arms, wherein the other end of the first strip is rotatably connected to a sleeve fixed on exterior surfaces of the first strand, whereas the other end of the second strip is rotatably connected to a fastening piece fixed to one end of the second strand, this fastening piece covering the electric connector when the clasp is in the closed position, wherein the fastening means are provided in the base and on the strips to lock one part of each strip into the base in the closed position, and wherein an unlocking button mounted on the base can be activated manually to release the strips from their closed position.

25. (canceled).

26. (previously presented): The wristband according to claim 17, wherein the electronic component is a non-volatile memory in which personal data can be stored, the memory being placed on a support fixed directly to the electric connector and electrically connected to conductive paths of the connector.

27. (previously presented): The wristband according to claim 17, wherein the first wristband strand receiving the electric connector includes a hollow part from the free end of the clasp which extends over at least one portion of the length of strand, this hollow part being delimited by a top wall and a bottom wall separated by two lateral walls, and wherein one part of the electric connector with the memory support is housed and fixed into one portion of the hollow part.

28. (previously presented): The wristband according to claim 27, wherein several apertures of circular shape are regularly spaced on either side of the lateral walls of the hollow

part of the flexible strand and in the lengthways direction of the wristband so that the size of the strand can be adjusted to a user's wrist.

29. (previously presented): The wristband according to claim 27, wherein the part of the connector to be fixed can also include, in a transverse direction to the wristband, a through aperture for the passage of a pin to be secured to the wristband, and wherein a sleeve placed on the external surfaces of the hollow part is fixed using the pin with the electric connector, said securing pin passing through one aperture of each lateral wall of the wristband strand in proximity to the end of said strand.

30. (withdrawn): The wristband according to claim 20, wherein the connector of the universal serial bus type includes at least one aperture on an external wall for cooperating with at least one hook of a locking member of a securing unit of the female part of the clasp in order to hold the clasp in the closed position when the connector is housed in a cavity of complementary shape of the securing unit, one part of the locking member outside the securing unit being able to be activated manually in order to open the clasp.

31. (currently amended): A watch including a wristband with a clasp according to claim 17, the wristwatch having at least one electric or electronic component electrically connected to electric connection means of the wristband, the electric connection means including an electric connector arranged in one part of the clasp, said connector being configured so as to be able to be connected, when the clasp is in the open position, to a connector of complementary shape of an electric apparatus to carry out electric energy and/or data transmission,

wherein the electric connector fixed to one end of one wristband strand forms the male part of the clasp, which is covered when the clasp is in the closed position by a fastening piece of another end of the same strand or one end of another strand of the wristband, and

wherein bellows of the clasp are fixed to one end of the second wristband strand underneath the fastening piece to enclose and protect the electric connector when the clasp is in the closed position with the bellows slightly compressed against a sleeve fixed to the end of the wristband strand with the electric connector.

32. (previously presented): The watch according to claim 31, wherein the electronic component is a non-volatile memory placed inside the case of the watch, the component being electrically connected to the electric connector placed in one part of the clasp by a connection path bus, and wherein the electric connector defines a universal serial bus type connector so as to be able to be connected to a connector of complementary shape of a computer station for data transfer.

33. (new): A wristband with a clasp including electrical connection means for electrical connection to at least one electric or electronic component, the electrical connection means including an electric connector arranged in one part of the clasp, said connector being configured so as to be able to be connected, when the clasp is in an open position, to a connector of complementary shape of an electric apparatus to carry out data and/or electric energy transmission with at least one electric or electronic component, wherein the electric connector fixed to one end of a strand of the wristband forms a male part of the clasp, which is covered

when the clasp is in the closed position by a fastening piece of another end of the same strand or an end of another wristband strand,

wherein the wristband strand receiving the electric connector includes a hollow part from the free end of the clasp which extends over at least one portion of the length of said strand, this hollow part being delimited by a top wall and a bottom wall separated by two lateral walls, wherein one part of the electric connector with the memory support is housed and fixed into one portion of the hollow part, and

wherein several apertures of circular shape are regularly spaced on either side of the lateral walls of the hollow part of the flexible strand and in the lengthways direction of the wristband so that the size of the strand can be adjusted to a user's wrist and allow fixing of the electric connector.
